

JBoss Enterprise Application Platform Implementation

WHAT IS IT?

JBoss Enterprise Application Platform is the market-leading, open source enterprise Java platform for developing and deploying innovative and scalable Java applications. Combining a robust, yet flexible, architecture with an open source software license, Enterprise Application Platform has become the most popular middleware system for developers, independent software vendors (ISVs), and enterprises alike.

WHAT DOES IT DO?

JBoss Enterprise Application Platform has the following key features:

- Complete Eclipse-based Integrated Development Environment
- Supports a wide range of Java EE and Web Services standards
- Enterprise Java Beans and Java Persistence
- JBoss Seam Framework and Web Application Services
- Caching, Clustering, and High Availability
- Implements the standard J2EE Authentication and Authorization (JAAS) security model
- Web Services and Interoperability
- Integration and Messaging Services
- Embeddable, Service-Oriented Architecture

WHY SHOULD I CARE?

Why build your next generation middleware architecture on the same expensive, proprietary products? Attack your IT project backlog. Switch to JBoss Enterprise Application Platform for:

- **More Capability, Less Costs:** Delivered via subscription. So you pay for what's most important to you. Service. Software that works.

- **No Vendor Lock-in:** The development process is open. The technology is open. There are no secrets, no surprises, no lock-in.
- **Award-Winning Support:** Ranked highest in custom satisfaction over Oracle, IBM and BEA in an [independent study](#) 2 years running.
- **Performance:** Just [ask our customers](#) why they trust JBoss Enterprise Application Platform with their mission critical applications.
- **Modular Architecture:** Robust enough to handle large, complex JavaEE workloads, yet agile and flexible enough to run lighter ones.

JBoss Enterprise Application Platform provides more capability, award-winning support, and no vendor lock-in. All at a much lower cost.

SCOPE

The JBoss Enterprise Application Platform implementation service is typically delivered in 3 — 5 days. For more complex engagements, a separate statement of work may be necessary. For the 3 — 5 day JBoss Enterprise Application Platform implementation service, Red Hat will provide a technical consultant— a Red Hat and JBoss Certified Consultant that performs the work, manages all stages of the engagement (day-to-day and long-term projects), provides full knowledge transfer, and completes any necessary documentation.

REQUIREMENTS

This project relies on having ready access to the personnel responsible for the development, deployment, and production support of the applications and infrastructure in question. It is critical that these individuals be involved in the planning phases of the project and available for information and assistance in later phases. More specifically, the customer will need to provide access to one or more of the following:

- **Project sponsor:** This person is the ultimate sign-off authority at the client, provides the high-level overview of long-term goals and objectives, and is typically an IT director.
- **Project manager:** This individual acts as the direct contact with Red Hat's technical consultant, manages the day-to-day client side activities, and ensures the timely delivery of information required for the project.
- **IT and other staff:** These people provide the information about the client's IT infrastructure and future requirements. Resources from development, operations, planning, purchasing, accounting, or finance may be incorporated into the project team or accessed via the project manager as appropriate.
