

SOA-P DEVELOPMENT WORKSHOP

USE THE POWER OF INTEGRATED, AUTOMATED BUSINESS PROCESSES

WHAT IS IT?

The JBoss® Enterprise SOA Platform integrates applications, services, transactions, and business components into streamlined automated business processes.

This fixed-price workshop will walk you through the design and development of business applications deployed as services on the JBoss Enterprise SOA Platform.

WHAT DOES IT DO?

In the SOA Platform Development Workshop, a JBoss consultant will come to your site and provide your team with the knowledge you need to successfully introduce SOA application development based on the JBoss Enterprise SOA Platform. This workshop consists of formal presentation of the development process intertwined with SOA Platform product capabilities. Case study lab exercises are performed throughout the workshop.

After this workshop, you'll be able to implement your business processes with reusable services through JBoss technologies. Adopting this development process will let you take advantage of the full power of a service-oriented approach and more rapidly realize your return on investment in SOA.

WHY SHOULD I CARE?

As organizations grow, processes and functionality are often re-invented and duplicated across diverse groups within the same company. In an effort to normalize and optimize business functions with reusable and manageable services and to establish IT governance structures, many enterprises embrace a service-oriented architectural approach.

The SOA strategy lets you deliver value to your business by reusing existing business functions and data throughout the enterprise and integrating them into automated processes. Not only does this approach make your IT infrastructure more agile and less complex, it can also reduce software development, maintenance, and system

administration overhead by providing consistent, common ways of solving similar or related tasks throughout the organization. You get increased productivity and a more efficient business.

With JBoss Enterprise SOA Platform, Red Hat gives you a highly reliable, open source SOA platform with related services to help you improve resource utilization and usability. But the SOA Platform itself won't deliver the value of a service-oriented architecture unless you have a well-planned, repeatable, structured development process.

Combining platform software and the development process from one source reduces development complexity and helps you achieve your goals. This SOA Platform Development Workshop will enable you to efficiently implement services with the JBoss SOA Platform so that you can realize the bottom-line benefits a JBoss-based SOA strategy can deliver.

SCOPE

A Red Hat consultant will:

- present a structured, documented process for developing service-oriented applications.

- provide details on SOA Platform product features (capabilities and configuration) that support the development process.

- mentor the attendees through a series of labs supporting a single business process using the Red Hat SOA development process and SOA Platform.

WHAT DO I GET?

- Introduction to a service-oriented development process.
- Detailed information about JBoss SOA Platform features, capabilities, and configuration.
- Hands-on practice creating and orchestrating services and in using JBoss Developer Studio.
- Immediate Q&A as you go through a consistent set of lab assignments that take you from business analysis through service deployment and testing.
- Hard copy of presentation material from the workshop for future reference.

REQUIREMENTS

To ensure smooth service delivery, the following people from your organization should be available to work with the consultant during the engagement:

Sponsor. Provides guidance, acts as an escalation point if necessary, and is your ultimate sign-off authority or fixed-price consulting engagements.

Project manager. Manages your day-to-day activities related to the engagement and ensures the timely delivery of information required for the project.

IT and other staff. Provide Red Hat the relevant and necessary information about your IT infrastructure.

As this is an interactive workshop, you'll also need a classroom, projector, white board, and student computers (2 GB RAM minimum).
