Agenda

● Intro to .NET Core
  ○ Differences from .NET*
  ○ Development Tooling
  ○ Container implications for .NET apps
● In Action
  ○ .NET Core RHEL -> Containers -> OpenShift
  ○ Source to Image
  ○ SQL Server
    ■ Persistent Storage
    ■ Initializing Databases
  ○ Advanced
  ○ Tooling
Exciting times ahead for .NET

**.NET FRAMEWORK**
Multi-purpose, comprehensive framework for desktop and web applications

**MODERN DEVICE EXPERIENCES**
- Universal Windows Platform
  - Unified development across Windows devices
- Xamarin
  - Extend your reach to any device with .NET

**MODERN CLOUD EXPERIENCES**
- .NET Core
  - Cross-platform, high performance .NET
- ASP.NET Core
  - Cloud optimized framework for micro services
.NET today—the family gets bigger

<table>

.NET today—app models and libraries

- **.NET FRAMEWORK**
  - WPF
  - Windows Forms
  - ASP.NET

- **.NET CORE**
  - UWP
  - ASP.NET Core

- **XAMARIN**
  - iOS
  - OS X
  - Android

- **APP MODELS**
  - ASP.NET
  - Windows Forms
  - WPF

- **BASE LIBRARIES**
  - Base Class Library
  - Core Library
  - Mono Class Library

- **COMMON INFRASTRUCTURE**
  - Compilers
  - Languages
  - Runtime components
Languages

**C#**

*Flexible, powerful, multi-purpose*

- Investments in C# 7: Evolve for modern patterns in distributed applications: tuples, pattern matching, others.

**VB**

*Simple, easy to use*

- Investments in VB 15: Bring key language features and platforms while keeping VB simplicity principles.

**F#**

*Elegant functional programming*

- Investments in vNext: Language updates for C# 7 / VB 15 interop, platform support and tooling updates.
.NET innovation

.NET CORE

- New open source and cross-platform .NET runtime and library stack
- High performance, including native compilation
- New set of command-line tools—”.NET Core CLI”—for compiling and publishing apps
- Supports app local, “shared framework,” and Docker deployment

ASP.NET CORE

- ASP.NET Core builds on top of .NET Core
- Single framework for web pages, services, and microservices
- Introduces concept of middleware pipeline, enabling you to inject as little or much functionality as needed
- Fully integrates with CLI tooling and uses the shared framework
- Takes advantage of .NET Core performance and includes a very high performance web server, built on LibUV
# Tools for any developer and any app

ASP.NET

Improved tooling and frameworks

• Deliver value faster with improved tooling and frameworks

ASP.NET Core 1.0

• Smaller footprint
• Modular
• Faster
• Any Platform

Cloud-Ready

• Tools and frameworks ready for seamless transition to cloud.
• Remote diagnostics on the cloud.
• Container support via Docker.
You can create .NET Core apps that run on Windows, Linux and Mac.

Runtime, libraries, compiler, languages and tools are all open source on GitHub where contributions are accepted, tested and fully supported.

No impact deployment and a modular development model where you only take dependencies on the minimal set of packages you need.

Multiple language support with C#, VB, F# and modern constructs like generics, Language Integrated Query (LINQ), async support and more.

.NET Core supports multiple editors and development environments with a simple set of command line tools available across operating systems.

Reuse code and skills using the same languages, compilers and libraries across the multiple .NET platforms.

Native compilation across platforms and high performance ASP.NET Core is 8x faster than Node.js and 3x faster than Go.
Open source .NET

Platforms

• General purpose .NET Core runtime, compilers and libraries

• ASP.NET Core web server stack

• Xamarin SDK (runtime, libraries, command line tools)

Fully supported cross-platform

• Windows, Linux and OS X

• Visual Studio tooling support (e.g. debugging and deploying to Docker in Linux)

• Omnisharp extensions to cross-plat IDEs (Sublime, Emacs...)

Open Source

• .NET Core and ASP.NET Core source being developed on GitHub

• Contributions accepted, tested and fully supported

• Close collaboration with Mono community

What is open source?

Get started from:

github.com/microsoft/dotnet
.NET Core and SQL Server In Action
.NET Core on RHEL without OpenShift
Installing and testing a simple app in Red Hat Enterprise Linux without containers

- Enable the proper .NET Core channel so you can access rpms
  - e.g. `subscription-manager repos --enable=rhel-7-server-dotnet-rpms`
- `yum install rh-dotnetcore11`
- `yum install scl-utils` and then `scl enable rh-dotnetcore11 bash`
- `dotnet new`
- `dotnet restore`
  - *What’s restore do? ... NuGet packages*
- `dotnet run`
Developing .NET Apps on OpenShift

How about .NET Microservices running in a polyglot container platform?

● .NET app development on OpenShift
  ○ .NET Core in containers - packaged with everything it needs to run
  ○ Option 1 - use the image available in Red Hat’s registry:
    ■ FROM registry.access.redhat.com/dotnet/dotnetcore-11-rhel7
  ○ Option 2 - use Source 2 Image (S2I)

● Why S2I?
  ○ Leverage pre-made and supported base container images
  ○ Layers just your code on top
  ○ Developers focus on the code, not the Dockerfiles and container building
    ■ You can customize the S2I using scripts and env variables
Deploying .NET Apps via S2I

Let’s see a demo of deploying a .NET web service with S2I
SQL Server
Persistent Storage
Persistent Storage (Static Method)

Administrator
- Register PVs in the pool

Developer
- Claim PVs in the pool
- Use PVs in applications

Persistent Volume (PV)
- Admin Owned

Persistent Volume Claim
- User Owned

Pod
Persistent Storage (Dynamic Method)

Developer

Dynamically Provision PVs
Use PVs in applica5ons

Configured Provisioners

Claim Request

GCE
GlusterFS
Amazon EBS
Initializing Databases

- Create custom image with already loaded
- Automate some process that lives outside of OCP (i.e. Jenkins)
- Use a container
  - Pod Lifecycle Hooks
  - InitContainers
  - Co-located container in the pod
  - Job (hint: use templates!)
  - Bake it into the app
    - Consider (Extended builds or Multi-State Builds)
