# GIVING POWER TO THE PEOPLE With ANSIBLE @ General Mills

Ops | Devs | Net

Ashley Nelson  
DevOps Engineer - General Mills

Mike Dahlgren  
Sr. Cloud Solution Architect - Red Hat

# ***WHO ARE WE?***

***ASHLEY NELSON  
DEVOPS @ GEN MILLS***

***MIKE DAHLGREN  
CLOUD SA @ REDHAT***

# ***AGENDA!***

- × History of Automation at General Mills
- × Use Case #1: Operations
- × Use Case #2: Networking
- × Use Case #3: Application Management
- × Operationalizing Ansible and Tower

**GMI'S**

**HISTORY**

**OF AUTOMATION**

**C**

Large File Copy Script

**Perl**

SAN Zoning Script

**Bash**

VM Storage Script

**Python**

Linux Group Mapping Script

**Ruby**

Server Provisioning Scripts

**Puppet**

Server Config Deployment

# ***ROOM FOR IMPROVEMENT***

*Portability*

*Supportability*

*Integration*

*Locality*

*Knowledge  
Sharing*

*Permissions*

# ***WHY ANSIBLE?***

## **No Setup**

RPM Installation  
Use existing SSH

## **Python-based**

On Linux by default  
Familiar with language

## **Intuitive**

YAML – markup language  
Sequentially executed

## **Integration**

No need to change environment  
Works alongside Puppet  
Glues automation together

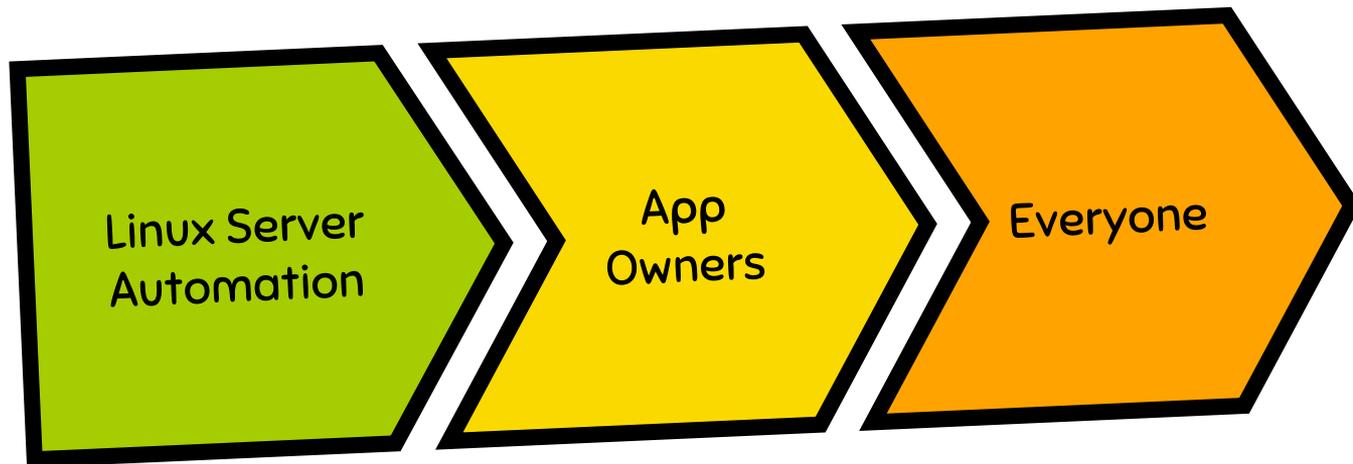

## **Ecosystem**

Modules for a variety of use cases  
Most of our vendors have modules

## **Ad-hoc Tasks**

Runs automation just once  
Don't always need to worry about idempotence

# ***ANSIBLE @ GENERAL MILLS***

# ***WHY TOWER?***

## ***PRIVILEGED ACCESS***

Non-server admins  
can execute  
privileged  
automation

No access to  
playbook or  
credentials

## ***USER INTERFACE***

Easier for people  
that are unfamiliar  
with Linux and the  
command line

## ***API***

Enables end to end  
automation when  
Ansible is not at the  
beginning of the  
pipeline

**#1**

***USE CASE: OPERATIONS***

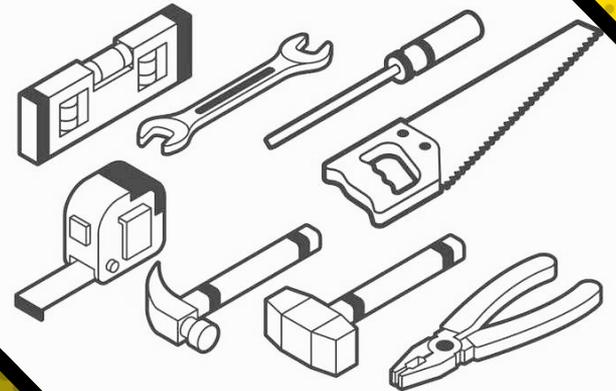

Integrate Everything

***EVERYONE LOVES  
SERVER PATCHING  
RIGHT?***

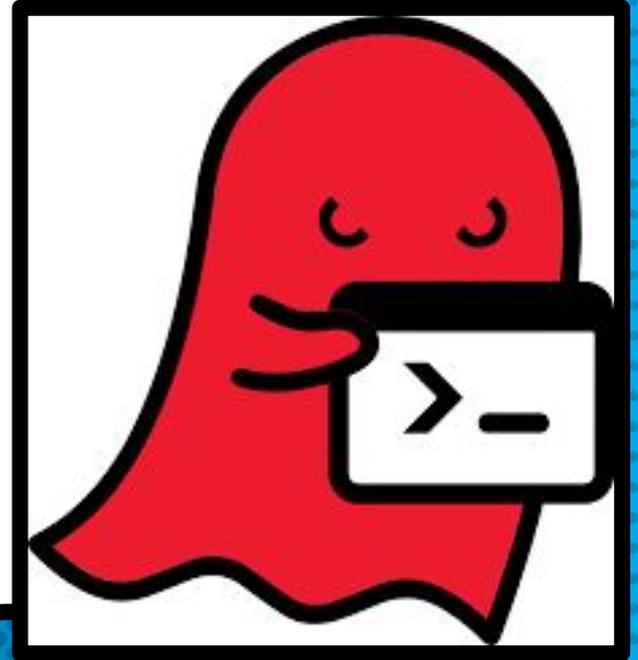

## ***THE OLD WAY***

- × Whole team in a room together
- × Divide up servers among everyone
- × Manually run commands
  - × Stop services
  - × Update packages
  - × Reboot
  - × Verify new kernel

# ***GLIBC GHOST VULNERABILITY***

Critical buffer overflow  
vulnerability that required  
immediate patching

- `assert: { that: "ansible_os_family == 'RedHat'" }`
- `name: update RHEL 7 channel`  
`command: /opt/gmi/tools/satellite/channels update {{ inventory_hostname }}`  
`delegate_to: job_server`  
`when: ansible_distribution_version == '7.1'`
- `name: upgrade all packages`  
`yum: name=* state=latest`  
`notify:`
  - `reboot machine`

# MY FIRST PLAYBOOK

## handlers:

- `name: reboot machine`  
`shell: sleep 2 && shutdown -r now "Ansible updates triggered"`  
`async: 1`  
`poll: 0`  
`ignore_errors: true`

**9 PEOPLE**

In a cramped room

**1 PERSON**

In their pajamas

**89%**

Labor savings

**WHERE DO  
SERVERS COME  
FROM?**

# Linux VM Request Form

hostname

## Network

- Enterprise (Tier 2)
- Mission Critical
- Mission Critical CLTX

## Vcenter and Cluster

### Physical Server (No VCenter)

- Physical Server mac address required

mgomtvosp2

# ***ANSIBLE ROLES***

Create VM

Setup  
PXE  
Config

Kickstart  
VM

Generate  
Host  
Keytab

Configure  
Puppet  
Client

Configure  
Puppet  
Server

Update  
Software  
+ Reboot

Install  
Backup  
Software

# CONFIG MAPPING

```
vm_compute_map:
  clustorr1:
    vcenter: xmvcsq1
    datacenter: QA1
    cluster: Cluster1
    network_type: standard
vm_network_map:
  mission_critical:
    template: rhel_tier1net
  enterprise:
    template: rhel_tier2net
kickstart_map:
  rhel68_virtual:
    kickstart_profile: rhel68-rhel-x86_64-server6
    pxe_provider: satellite
```

# PLAY FROM SERVER BUILD PLAYBOOK

```
- name: Set up PXE boot
  hosts: new_hosts
  gather_facts: false
  serial: 1
  vars_files:
    - build_config_maps.yaml
  tags:
    - before_kickstart
  vars:
    kickstart_profile: "{{kickstart_map[kickstart].kickstart_profile}}"
    vcenter: "{{vm_compute_map[vm_compute].vcenter}}"
    vmware_datacenter: "{{vm_compute_map[vm_compute].datacenter}}"
  roles:
    - pxe_config
```

# PHYSICAL SERVER BUILDS

- name: **get** HP ILO MAC address

hpilo\_facts:

host: "{{inventory\_hostname}}-ilo"

login: admin

password: "{{ lookup('ini', 'password section=ilo file=' + ilo\_pw) }}"

delegate\_to: localhost

connection: local

register: ilo\_facts

- name: **set** boot interface mac address fact

vars:

interface: "{{interface\_map[hp\_model]}}"

set\_fact:

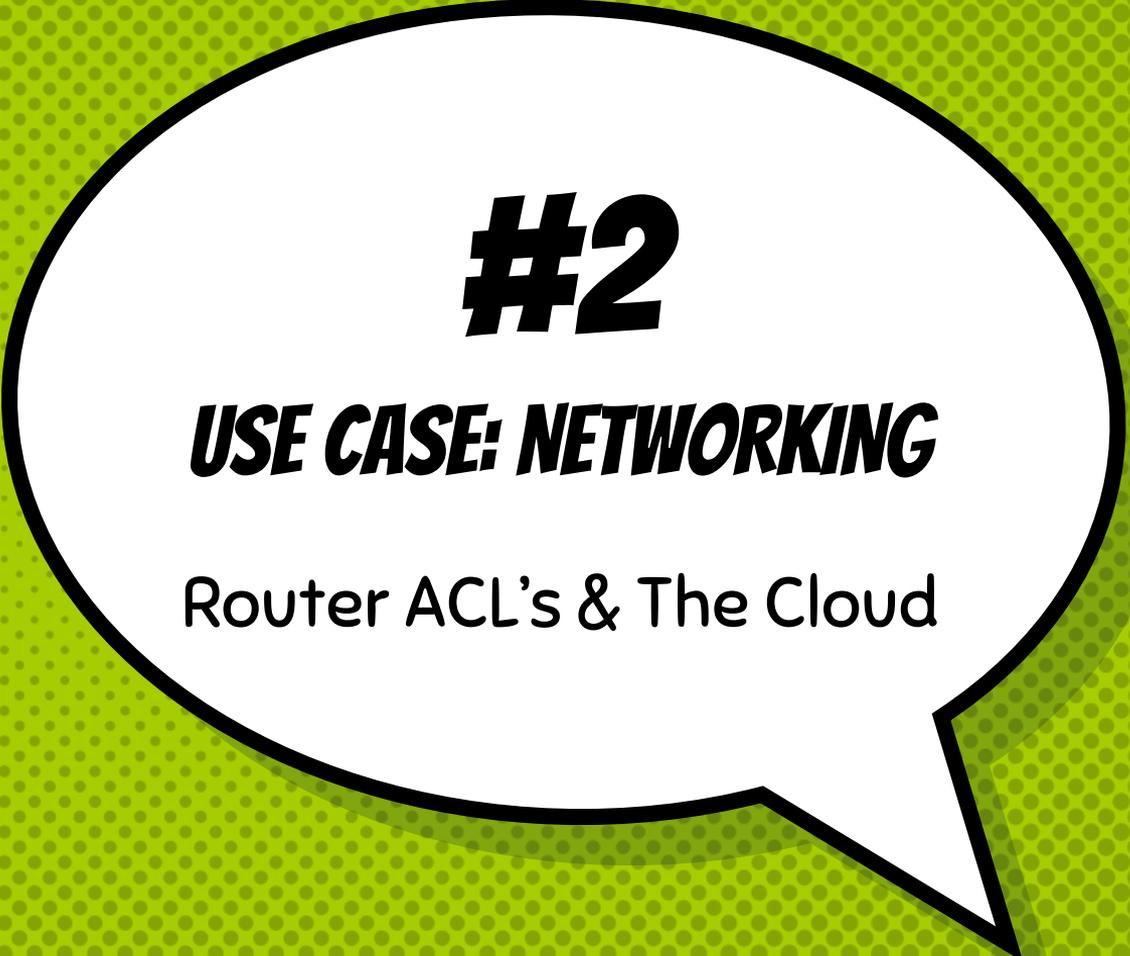

boot\_mac\_addr: "{{ilo\_facts.ansible\_facts[interface].macaddress | lower()}}"

boot\_mac\_addr\_dash: "{{ilo\_facts.ansible\_facts[interface].macaddress\_dash}}"

# ***RESULTS***

- × Fully automated server provisioning
- × 30 minutes of manual work to 1 minute
- × Easier to automate for change
  - × vCenters
  - × OS versions
  - × Networks

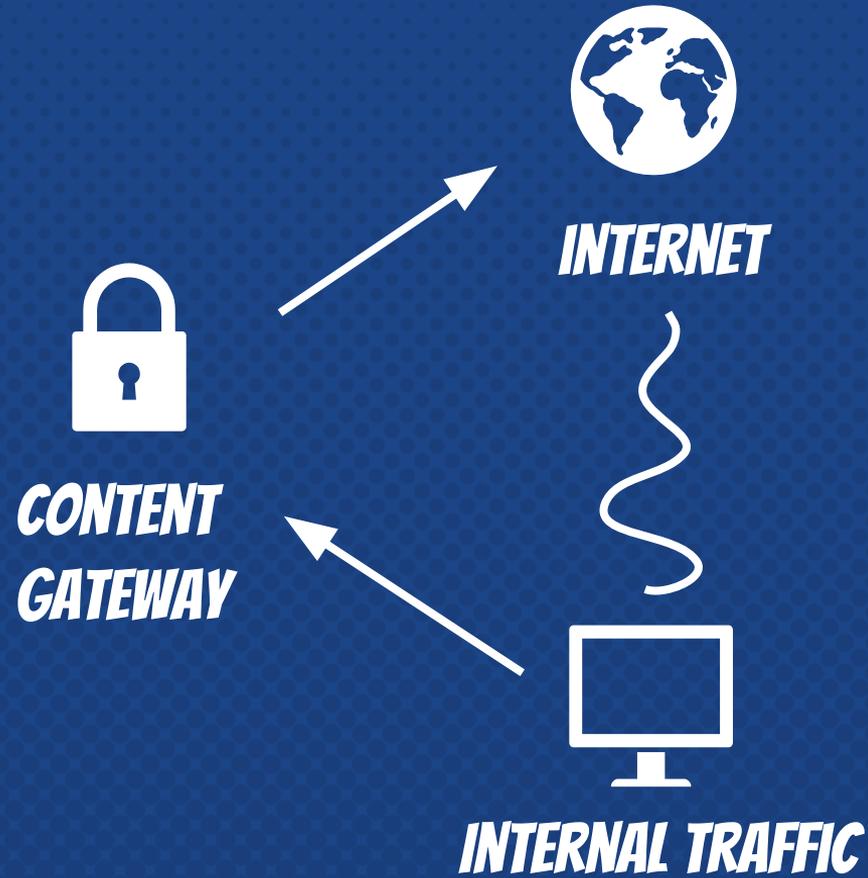

**#2**

***USE CASE: NETWORKING***

Router ACL's & The Cloud

**OFFICE 365, MICROSOFT EXCHANGE, AND SKYPE DON'T APPRECIATE GOING THROUGH THE REDIRECT**

**PROCESS OF MANUALLY CREATING WHITELIST WAS 10+ HOURS OF WORK 🤖**

# ***THE ANSIBLE APPROACH !***

## ***PLAYBOOK #1***

Detect whether Microsoft has updated their IP address list

## ***PLAYBOOK #2***

Retrieve new list and generate config to deploy to all routers

# PLAYBOOK SAMPLE

```
- name: GET MICROSOFT PRODUCT IP ADDRESSES
  shell: /mnt/data1/network/scripts/get_microsoft_product_ip_addr.py
  delegate_to: localhost
  run_once: true
  tags: always

- name: GENERATE INTERNET-WCCP ACCESS-LIST FILE
  template: src=internet_wccp.j2 dest={{acl_dir}}/internet-wccp.txt
  tags: generate_acl_file
...
- name: DEPLOY {{ inventory_hostname }} INTERNET-WCCP ACCESS-LIST
  napalm_install_config:
    provider: "{{ creds['conn'] }}"
    dev_os: "{{ dev_os }}"
    config_file: "{{acl_dir}}/internet-wccp.txt"
    commit_changes: True
    replace_config: False
    diff_file: "/tmp/{{ inventory_hostname }}.diff"
  tags: deploy_acl
```

## ***NETWORKING RESULTS***

- × Fully automated 10+ hours of tedious work
- × Removed human error from equation
- × Now updating router ACLs weekly
- × For the end user the Cloud just works!

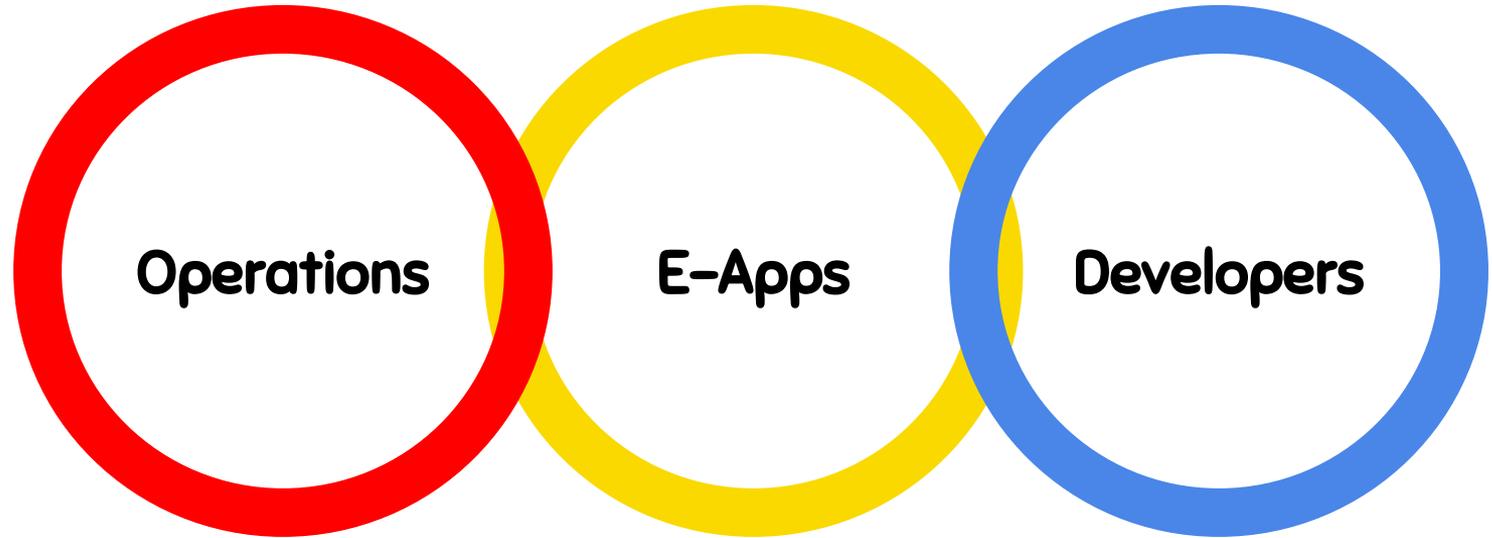

**#3**

***USE CASE: APP MANAGEMENT***

Empower the user!

# ***WHAT'S BETWEEN DEVOPS?***

# THE SITUATION...

The E-Apps Team

**11 PEOPLE**

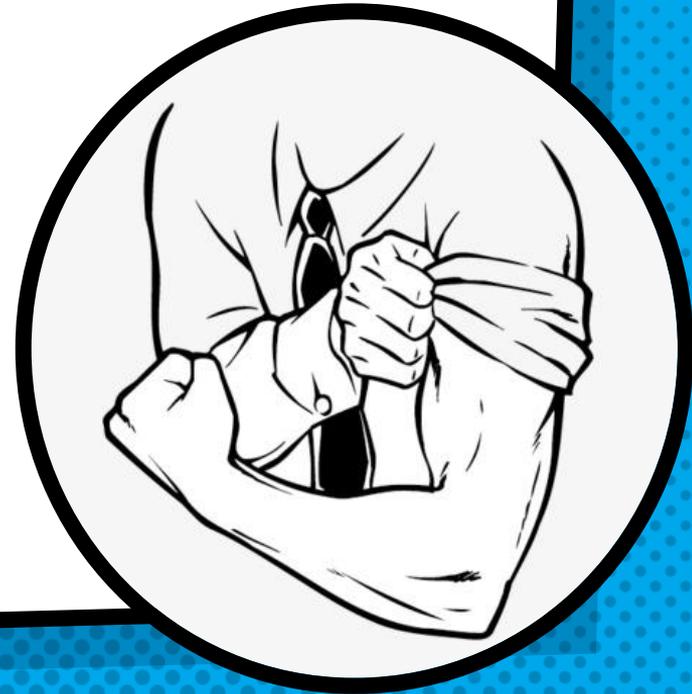

**150+ APPS**

- Responsible for Start/Stop/Deploy etc.
- Provided self-service for Win applications
  - SharePoint > Word Doc > watching process > JSON > PowerShell > 🌐
- Tasked with owning Linux applications
- Most of team not automation experts

# ***THE APPROACH***

***- ANSIBLE TOWER!***

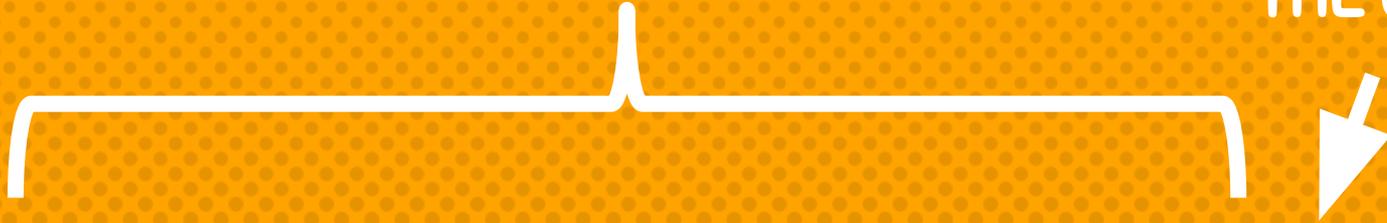

- × Put everything in GIT
- × Create a template of a template
  - × Allows E-Apps team to quickly build services for new apps
- × Used Tower Survey vs Word docs
- × Allow users to schedule actions

when: (win\_command == "stop") or (win\_command == "reboot")
  
- name: "Pause before stopping AppPool"  
pause:  
seconds: 60  
when: (AppPool\_state == "stopped") or (AppPool\_state == "restarted")
  
- name: "stop an application pool"  
win\_iis\_webappool:  
name: "{{AppPool}}"  
state: "{{AppPool\_state}}"  
when: (AppPool\_state == "stopped") or (AppPool\_state == "restarted")

# ***ADVANTAGES***

- Global changes can be made in one place
- Still allows for isolation
- Easily create Job templates
- Even without Ansible knowledge!

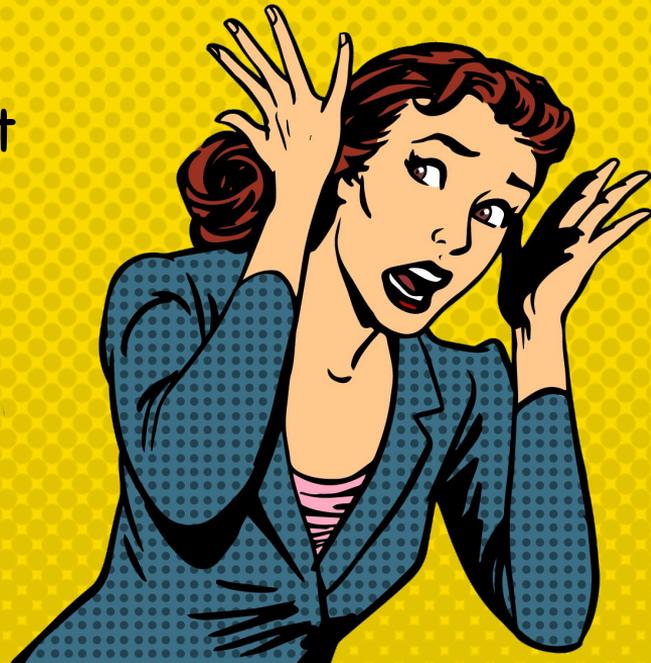

# CHALLENGES

## #1 WinRM

- Ansible wants to use HTTPS everywhere
- No GPO for certificate deployment
- Currently leveraging powershell script

## #2 Plan the organization first!

- Split out the middleware group
- Required moving 100's of templates
- Give people access to multiple orgs

## ***RESULTS***

- × Simpler interface for end users
- × 90% of team workload now automated by Ansible
- × Single automation platform for Windows + Linux
- × Changes the role of the E-app team
- × Can now focus on big picture projects

# OPERATIONALIZING ANSIBLE

## ***INTRODUCING TEAMS TO ANSIBLE***

- × Meet with teams to go over Ansible architecture
- × Linux → Ansible Core server
- × Windows → Ansible Tower
- × Segment teams by organization in Tower

# ***SHARING ROLES AND MODULES***

- × Open repositories in TFS
- × Enforce best practices
- × Required vs. optional variables documentation
- × Import roles with Ansible Galaxy CLI or git submodules

# ***CHALLENGES***

- × Python dependencies
- × Jump host with Windows
- × Integration with TFS
- × Job isolation

***YOU'RE NOT  
ALONE!***

Red Hat has support for Tower, Networking, and Engine.

Join your local Ansible meetups and RHUG's (Red Hat User Group).

# ***FUTURE PLANS***

- × Replace scripts with Ansible
- × Eliminate manual infrastructure changes
- × Setup Tower Isolated Nodes
- × Isolated Python environments for teams

## ***CREDITS***
